Abstract of corresponding document: **WO9950943**

The invention relates to a protective sheath for longitudinally extended objects, especially cables, wiring harnesses, lines and the like. The protective sheath has an at least two-layer construction made of at least two textile layers. A first textile layer constructed of a synthetic fiber non-woven material is provided on the object which is to be protected. A second textile layer is arranged on the exterior of the first layer. Said second layer is constructed of a two-barrier knitted velour having velour loops which are arranged such that they point outward. Both textile layers are glued to one another at least in places.
